### Exclusive Roll Bar Mount

(works for all Hero cameras and any other brand light-weight cameras)

Thank you for your purchase of our roll bar mount. If you've use the GoPro roll bar mount then you'll see very quickly how flexible this mount is. There are a variety of different configurations depending upon your needs. Any bars from 1 inch to 2 inches. Also try on wood, L-brackets, light stands, tripod legs, etc.

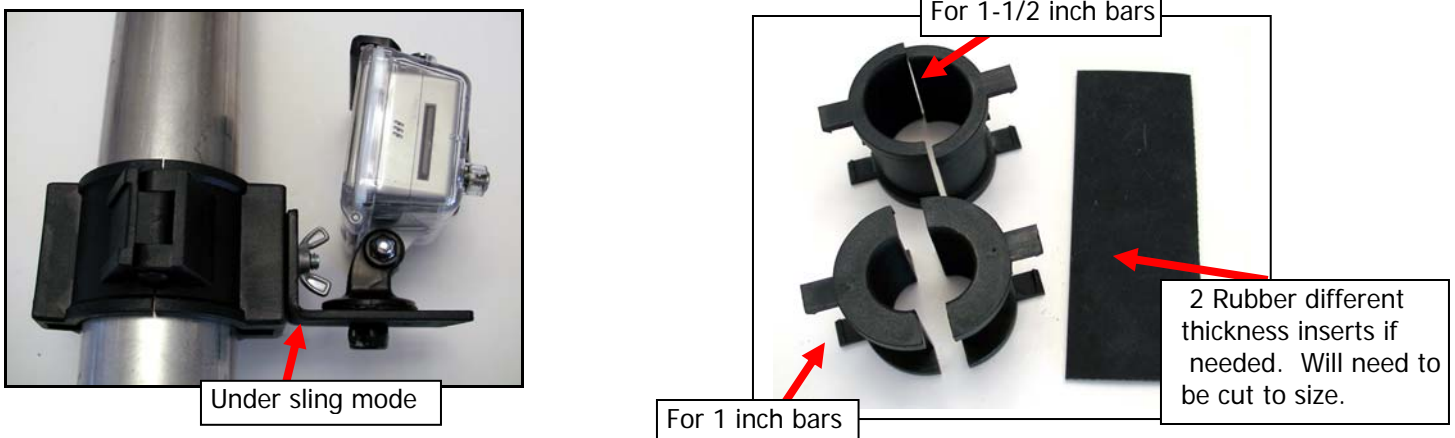

It is much easier to assemble the mount to the L bracket to the camera BEFORE putting on the vehicle.

1). For environments with little to moderate vibration, you can try these 3 configurations:

2). For environments with moderate to extreme vibration, put it in the under-slung mode only. This keeps the camera closer to the mount attach point reducing potential vibration.

Use the hole closest to the mount. Tighten everything really well And re-tighten throughout the event. We suggest you tape the wing-nuts in place.

Use the spacers for standard sized bars: thicker spacer is for 1 inch bars and thinner spacer is for 1-1/2 in bars. Use the rubber inserts for any bar that is not 1 inch, 1-1/2 inch or 2 inches to take up the slack. Rubber may need to be cut.
